

Occupational Safety & Health Fact Sheet

Overview

Protecting America's workforce and the general public from injury and illness has become one of the greatest challenges facing government and private industry. HAMMER's Occupational Safety and Health program provides up-to-date, technically sound, and effective hands-on training. A "worker-training-worker" approach is one of the cornerstones of the program's success.

In addition to worker training classes, the HAMMER Occupational Safety and Health program also offers Mastery Courses. Typical students at the mastery level are safety professionals, senior site safety officers, compliance officers, instructors and other personnel viewed as Competent Persons.

Because of the need for skilled support personnel to respond to terrorist or weapons of mass destruction incidents, additional elements of protective training in chemical, biological, and radiological exposures are being incorporated into the program.
